

PROJECT EXECUTABLE FILES

Date	30 September 2026
Team ID	UNM1401VisionTech
Project Name	ComicCraft - AI Comic Story Creator
Maximum Marks	3 Marks

Step 1: Submission Checklist

S.No	Item to Submit (PDF)	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	NA
5	Environment configuration file (.env.example or similar)	Yes
6	Deployed application URL (if hosted)	Yes
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

```
comiccraft-root/
├──
├── app/                - Core application backend logic (main.py, api_clients.py)
├── static/             - CSS, JavaScript, and saved generated panels/PDFs
│   ├── css/
│   ├── images/
│   └── exports/
├── templates/          - HTML templates (index.html, preview.html)
├── .env.example         - Template for API keys
├── .gitignore           - Files to ignore in version control
├── main.py              - Entry point for the FastAPI server
├── README.md            - Setup and run instructions
└── requirements.txt     - Python dependencies
```

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	https://comiccraft-ai.onrender.com (Example URL)
Platform / Hosting Provider	Render
Repository Link	https://github.com/UNM1401VisionTech/ComicCraft-AI
Login Credentials (Demo)	NA (Public access for generating stories)
Demo Video Link	https://youtube.com/your-demo-link

Step 4: Run Instructions

Pre-requisites:

- Python 3.8+ installed on your system.
- Active API keys for Google Gemini and Stable Diffusion.

Step 1: Clone the repository: `git clone https://github.com/UNM1401VisionTech/ComicCraft-AI.git`

Step 2: Navigate into the directory: `cd ComicCraft-AI`

Step 3: Create a virtual environment: `python -m venv venv`

Step 4: Activate the virtual environment: `venv\Scripts\activate` (Windows) or `source venv/bin/activate` (Mac/Linux)

Step 5: Install dependencies: `pip install -r requirements.txt`

Step 6: Configure environment: Copy `.env.example` to `.env` and paste your Gemini and Stable Diffusion API keys inside.

Step 7: Start the application: `uvicorn main:app --reload`

Step 8: Open your browser and navigate to `http://127.0.0.1:8000`

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Stable Diffusion API sometimes times out during heavy load.	Refreshing the page or retrying the generation usually works.
2	High-resolution PDF export can take up to 10 seconds.	Added a loading spinner to the UI so the user knows it is processing.
3	Generated text occasionally exceeds the PDF text box layout.	Implemented a strict character limit constraint in the Gemini prompt.
